To the Editor: We read with interest the recent article describing involvement of Crithidia-related parasites in visceral leishmaniasis (VL) in Brazil (1). In 2010, we published a similar study about the identification of Leptomonas sp., another monoxenous trypanosomatid, among clinical isolates from VL patients in India: of 120 cultured isolates, 111 were typed as L. donovani and 9 as Leptomonas sp. (2). As in the Brazil study, we infected BALB/c mice with 1 Leptomonas isolate; at 45 days postinfection, we found Leptomonas and Leishmania DNA by PCR in the animals’ spleens. Assuming that sterility was preserved during the experiment, we interpreted that original infection in patients resulted from a mixture of the 2 species, Leptomonas overgrew L. donovani in culture because of substantial growth advantage of the former, and a few remaining L. donovani cells in the culture spread in the animals after inoculation because of their higher in vivo fitness.

We suspect a similar phenomenon could have occurred in Brazil, and additional analyses are required to support the authors’ conclusions. Given that mice were inoculated with clinical isolates, postanimal typing should have been done. Furthermore, linking genotyping information of cultivated (cloned) strains with a patient phenotype is risky because of the selection biases of in vitro isolation and maintenance. Using a recently developed method for direct sequencing of L. donovani complex parasites in host tissues, we demonstrated that genotypes of parasites in bone marrow samples differed from derived and cultivated isolates. This result most likely was due to polyclonal L. donovani infections and differences in fitness of different genotypes in vitro and in vivo. On the basis of this evidence, we recommend direct parasite sequencing in clinical samples in future work. If impossible, results based on cultured isolates should be interpreted with caution. We recommend a follow-up study to verify the possibility of Crithidia/Leishmania co-infection and the capacity of Crithidia to cause leishmaniasis-like disease as a single infection.
